The following are pictures from the week of August 24th – 28th in regards to the Campus Sidewalk Repairs. Work has actually started a few days early with the area in front of the La-Z-Boy Center already going through the demolition process. This area is the first to be done as we want it completed in time for the upcoming event season in the Meyer Theater. In this area all of the concrete from the parking lot walk all the way up to the entry stoop is being removed. Additionally, we are taking out the current sub-base in order to install a newer, and hopefully better sub-base so that we can prevent some of the settling/heaving issues we have been experiencing over the last few winters.

In this picture you can see that the existing sidewalk all the way from the parking lot walk all the way up to the building entry stoop is being removed.

This is a close up photo of the building entry and the work going on in that area.

Here you can see that all the existing concrete has been removed and taken to a recycling center. Next the existing stone base will be removed and more of the existing soil underneath will be excavated. With that done a thicker base can be installed which we are hoping will help alleviate some of our settling/heaving issues in the winter time.
